GPs call for better training to fight France's obesity epidemic

Many say they lack the confidence to offer the best support to patients

May 17, 2018: General Practitioners (GPs) in France are calling for more and better training on obesity in order to improve treatment and care for patients.

A survey of more than 100 GPs in France has shown that almost a third of them (31%) are not confident enough about the complexities of obesity to offer the best support to patients, and only 39% think that GPs generally provide effective advice on losing weight and overcoming obesity.

According to the survey, conducted across seven European countries for the European Association for the Study of Obesity (EASO), 80% of GPs in France feel they should have more training on its causes, consequences and treatment. More than half of them (55%) reported having received less than four hours of such tuition during their entire medical training, which typically takes around 10 years.

This is despite the fact that 94% of the French GPs view obesity to be a serious danger to health in their country and 20% recognise it to be very serious.

The figures support the view of the World Health Organization that obesity is one of the greatest public health challenges of the 21st century as its prevalence has tripled in many countries in Europe since the 1980s¹.

A serious danger to health

Overall, GPs rank obesity fifth in a list of serious dangers to health. However, three of the top four – cancer, cardiovascular disease, and type 2 diabetes – commonly result from obesity.

The GPs agree that more effective treatment of obesity would significantly reduce the burden on the healthcare systems from the many other diseases and conditions on which it impacts.

Furthermore, there is wide agreement among GPs (83% of those interviewed in France) that obesity is a disease and should be more widely recognised and treated as such. Around 66% of them agreed that it would result in better patient care.

Only three countries in Europe (the Netherlands, Portugal and Spain) currently recognise obesity a disease.

Among other key findings are:

- Almost half of the GPs' patients in France are overweight or have obesity (49% in total: 32% overweight and 17% with obesity). The highest reported number of patients with obesity was in Germany (29%). The lowest is in the Netherlands (15%). The European average is 35% overweight and 23% with obesity.
- 17% of GPs in France rarely or only occasionally initiate discussions on weight with their patients with obesity. Across Europe the figure is 28%.
- Eating high fat/ high sugar food is seen by GPs in France as the most common cause of obesity (58%)
- Bariatric surgery is an effective treatment in helping patients with obesity to lose weight (according to 94% of GPs in France) and is considered a positive way of treating other diseases and conditions caused by obesity.

European Obesity Day

The survey was published today to coincide with a [European Policy Conference on Obesity](#) being organised in Brussels in the run up to [European Obesity Day](#) on Saturday (May 19).

“Despite the growing epidemic and the burden it places on healthcare systems, it is clear that GP’s are given very little training on obesity,” says EASO President, Professor Hermann Toplak.

“This is a major barrier to obesity treatment. More effort needs to be made to improve healthcare professionals’ understanding of obesity and comprehensive treatment approaches that can be delivered as part of patient care,” he said.

Further details about the survey are available on the European Obesity Day website: <https://www.europeanobesityday.eu/gpsurvey/>

About EASO

EASO is Europe's leading organisation responsible for research into obesity and is the voice of the European obesity community, representing scientists, health care practitioners, physicians, public health experts and patients.
